7. Outlook

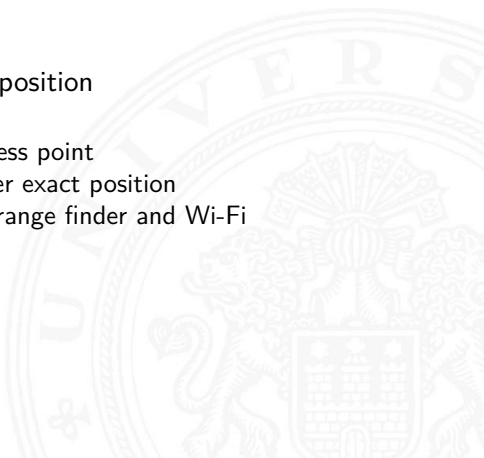

- ▶ Localization is important problem in robotics
- ▶ Example autonomous vehicle [Levinson et al., 2007]
 - ▶ GPS for rough global position
 - ▶ LIDAR for precise localization
- ▶ Specific LIDAR is popular in robotics
- ▶ GPS Signal unreliable

- ▶ Global localization
 - ▶ Problematic Situations
 - ▶ Often fails
- ▶ Wi-Fi signal strength to infer position
 - ▶ MAC-address
 - ▶ Signal strength for every access point
 - ▶ Multiple access points to infer exact position
 - ▶ Combining strength of laser range finder and Wi-Fi

- ▶ Different approaches to Wi-Fi localization
- ▶ Propagation model [Serrano et al., 2004]
- ▶ Pre-recorded signals
 - ▶ Linear interpolation [Biswas and Veloso, 2010]
 - ▶ Recording data in grid-like fashion
 - ▶ Robot can only move on the grid lines
 - ▶ Gaussian processes [Ferris et al., 2006]
 - ▶ Regression
 - ▶ Recording data is not restricted
- ▶ Global Localization using Wi-Fi in different Contexts
 - ▶ Industrial Environment [Duvall et al., 2008]
 - ▶ Iphone [Ito et al., 2014]

Kidnapped Robot Problem

Motivation

Basics

Implementation

Demo

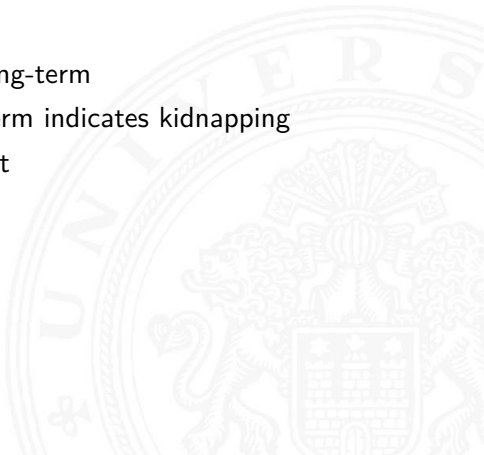

Experiments and Results

Conclusion

Outlook

References

- ▶ Average of weights
- ▶ Comparing short-term with long-term
- ▶ Lower short-term than long-term indicates kidnapping
- ▶ Adding random particles to set

- ▶ SSID not unique
- ▶ MAC-address unique
- ▶ Signal Strength measured in dBm
 - ▶ The higher the value, the stronger the signal
 - ▶ Logarithmic measurement scale
 - ▶ Range from -40 dBm to -90 dBm
- ▶ Wi-Fi channels

Wi-Fi Sensor Model

Gaussian Process Regression

Motivation

Basics

Implementation

Demo

Experiments and Results

Conclusion

Outlook

References

- ▶ Two common approaches to regression:
 - ▶ Restricting the classes of functions
 - ▶ Putting a prior over all functions
- ▶ Gaussian processes to put prior over all functions
- ▶ Gaussian processes are generalization of Gaussian distributions
 - ▶ Gaussian distribution: distribution over scalars or vectors
 - ▶ Gaussian process: distribution over functions

Wi-Fi Sensor Model

Covariance Function

Motivation

Basics

Implementation

Demo

Experiments and Results

Conclusion

Outlook

References

- ▶ Prior is defined by a covariance function
- ▶ Different covariance functions will lead to different results
- ▶ Radial basis function (RBF) kernel
- ▶ $k(x_p, x_q) = \sigma_f^2 \exp\left(-\frac{1}{2\ell^2}(x_p - x_q)^2\right) + \sigma_n^2 \delta_{pq}$
- ▶ Hyperparameters: σ_f, ℓ, σ_n

Wi-Fi Sensor Model

Gaussian Process

Motivation

Basics

Implementation

Demo

Experiments and Results

Conclusion

Outlook

References

- ▶ Gaussian distribution for every coordinate
- ▶ probability of signal strength
- ▶ Compute weights

Wi-Fi Sensor Model

Hyperparameter Optimization

Motivation

Basics

Implementation

Demo

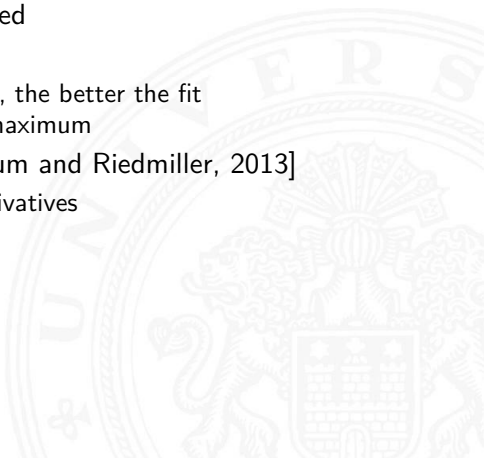

Experiments and Results

Conclusion

Outlook

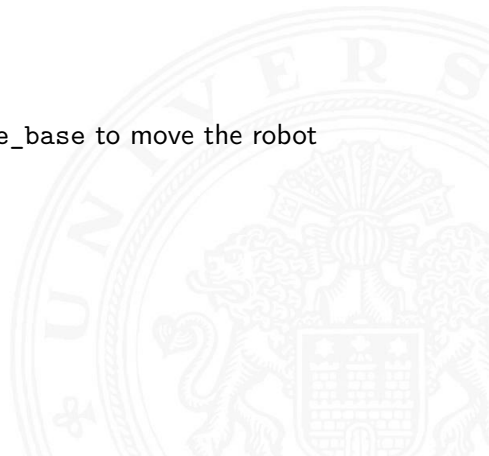

References

- ▶ Hyperparameters can be learned
- ▶ Log-likelihood function
 - ▶ The higher the log-likelihood, the better the fit
 - ▶ Using derivatives to search maximum
- ▶ Resilient backpropagation [Blum and Riedmiller, 2013]
 - ▶ Sign of partial first order derivatives

- ▶ Implemented with ROS
- ▶ Using AMCL for localization
 - ▶ failure probability
- ▶ `turtlebot_teleop` and `move_base` to move the robot

- ▶ Needed data:
 - ▶ MAC-address
 - ▶ Wi-Fi signal strength
- ▶ Using terminal command
 - ▶ `sudo iw dev wlan0 scan`
 - ▶ `sudo iw dev wlan0 scan freq 2432`

Wi-Fi Position Estimation

Motivation

Basics

Implementation

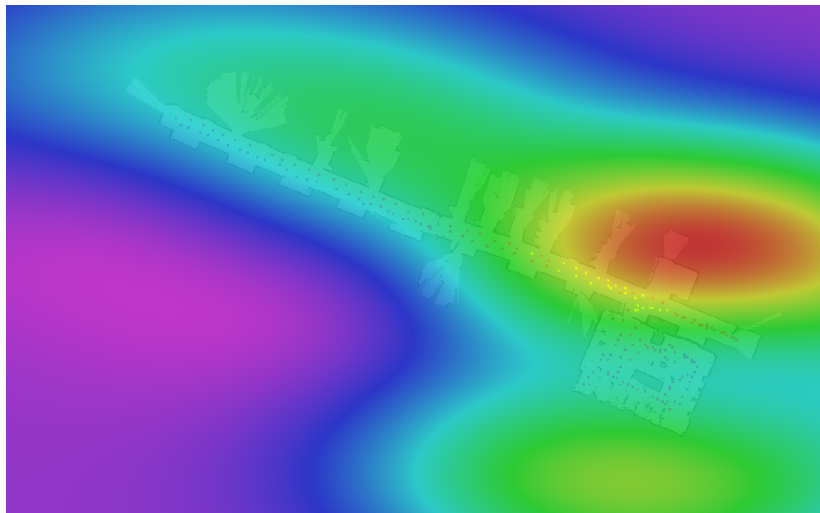

Demo

Experiments and Results

Conclusion

Outlook

References

- ▶ Gaussian process for every MAC-address
- ▶ Train processes at first start
- ▶ Particles spread over map
- ▶ Compute weight for every MAC-address observed
- ▶ Multiply weights
- ▶ Highest weight is most likely position

Experiments and Results

Conclusion

Outlook

References

- ▶ 20 different goals on the hallway the robot drives to
- ▶ At each point the groundtruth is recorded using AMCL
- ▶ Wi-Fi position estimation is used at each goal
- ▶ Compare Wi-Fi position estimation with AMCL ground truth
- ▶ Mean error of **1.81 meters**

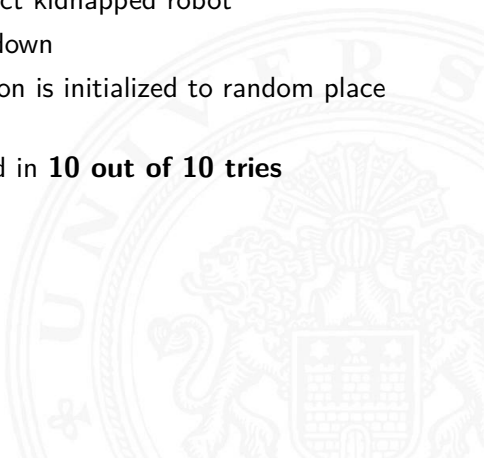

Experiment 2

- ▶ Robot drives to 20 different goals on the hallway
- ▶ At each goal the Wi-Fi position estimation is called
- ▶ AMCL gets the result as new initial position
- ▶ When the robot arrives at the next goal, the difference to the true pose is recorded
- ▶ Wi-Fi position estimation used for global localization
 - ▶ Mean error of **2.23 meters**
 - ▶ Successful in **9 out of 19 tries**
- ▶ Common method for global localization
 - ▶ Mean error of **17.34 meters**
 - ▶ Successful in **1 out of 19 tries**

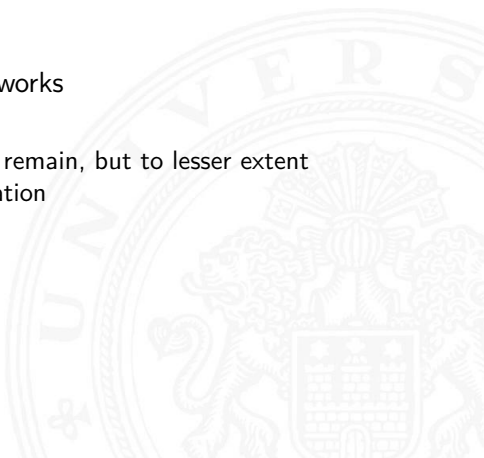

Experiment 3

- ▶ Using average weights to detect kidnapped robot
- ▶ Robot drives hallway up and down
- ▶ After some time the localization is initialized to random place on map
- ▶ Kidnapped robot was detected in **10 out of 10 tries**

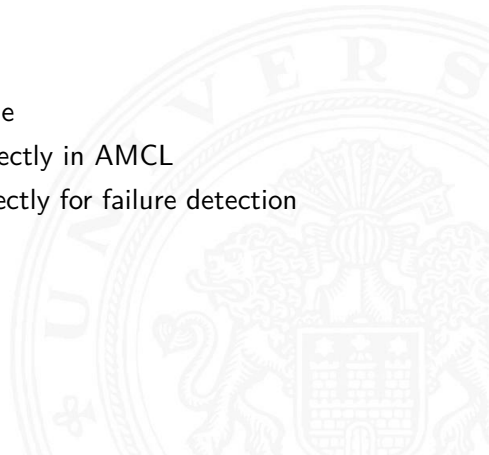

- ▶ Wi-Fi position estimation is accurate enough to give AMCL initial pose
- ▶ Improved global localization
- ▶ Localization failure detection works
- ▶ Problems:
 - ▶ laser range finder's problems remain, but to lesser extent
 - ▶ No information about orientation
 - ▶ Computation time
 - ▶ Wi-Fi scan time

- ▶ Different kernel to heighten accuracy
- ▶ Compass for orientation
- ▶ Speeding up Wi-Fi scan
- ▶ Speeding up computation time
- ▶ Applying the Wi-Fi model directly in AMCL
- ▶ Using Wi-Fi sensor model directly for failure detection
