Task-level Programming and Path Planning

Task-level Programming and Path Planning

- Recapitulation

- Potential Field Method

- Probabilistic Approaches

- Application fields

- Extension of Basic Problem and Applications

- Practical Example: Path Planning with MoveIt

Architectures of Sensor-based Intelligent Systems

Summary

Conclusion and Outlook

Partition based Path Planning – Methods

Task-level Programming and Path Planning - Recapitulation

Introduction to Robotics

Advantages:

- ▶ Complete in case of sufficient resolution
- ▶ Global overview

Disadvantages:

- ▶ High demand for RAM
 - ▶ Curse of Dimensionality
- ▶ Complex to implement
- ▶ Practically implementable only for few degrees of freedom

Path planning without explicit representation of free space?

this Lecture!

Definition

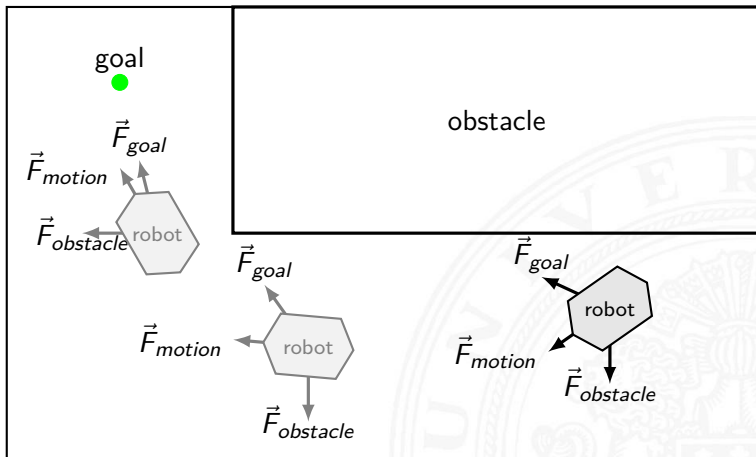

The manipulator moves in a field of forces. The position to be reached is an attracting pole for the end effector and obstacles are repulsive surfaces for the manipulator parts.

[13]

- ▶ Initially developed for real-time collision avoidance
- ▶ Potential field associates a scalar value to every point in space
- ▶ An ideal field used for navigation should
 - ▶ be smooth
 - ▶ have only one global minimum
 - ▶ the values should approach ∞ near obstacles
- ▶ Force applied to the robot is the negative gradient of the potential field
- ▶ Robot moves along this force
- ▶ A function is defined in the free space, which has a global minimum at the goal configuration
- ▶ Motion follows steepest descend of the gradient

Basic Principle (cont.)

- ▶ The attracting force (of the goal)

$$\vec{F}_{goal}(\mathbf{x}) = -\kappa_{\rho}(\mathbf{x} - \mathbf{x}_{goal})$$

- ▶ where
 - κ_{ρ} is a gain factor
 - $(\mathbf{x} - \mathbf{x}_{Goal})$ is the distance between current and goal position

- ▶ The potential field (of obstacles)

$$U(\mathbf{x}) = \begin{cases} \frac{1}{2}\eta\left(\frac{1}{\rho(\mathbf{x})} - \frac{1}{\rho_0}\right)^2 & \text{if } \rho(\mathbf{x}) \leq \rho_0 \\ 0 & \text{else} \end{cases}$$

- ▶ where
 - η is a constant gain factor
 - $\rho(\mathbf{x})$ is the shortest distance to the obstacle O
 - ρ_0 is a threshold defining the region of influence of an obstacle

- ▶ The repulsive force of an obstacle

$$\vec{F}_{obstacle}(\mathbf{x}) = \begin{cases} \eta \left(\frac{1}{\rho(\mathbf{x})} - \frac{1}{\rho_0} \right) \frac{1}{\rho(\mathbf{x})^2} \frac{d\rho(\mathbf{x})}{d\mathbf{x}} & \text{if } \rho(\mathbf{x}) \leq \rho_0 \\ 0 & \text{if } \rho(\mathbf{x}) > \rho_0 \end{cases}$$

- ▶ where $\frac{d\rho(\mathbf{x})}{d\mathbf{x}}$ is the partial derivative vector of the distance from the point to the obstacle. This way, the direction of the force vector is expressed

[13]

Advantages and Disadvantages of PFM

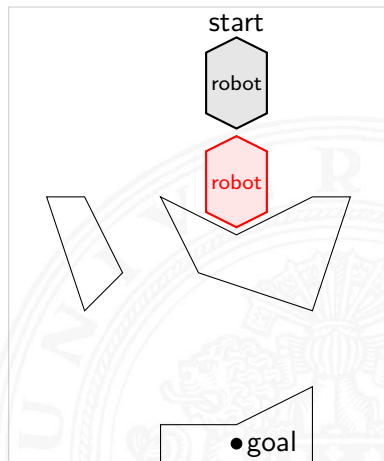

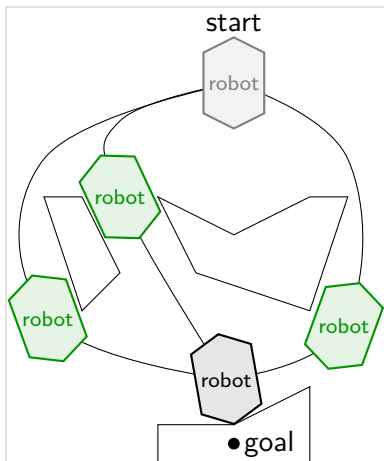

Advantages:

- ▶ Usage of heuristics
- ▶ Real-time capable

Disadvantages:

- ▶ Completeness
 - ▶ existing solution might not be found
 - ▶ calculation might not terminate if no solution exists
- ▶ Problem with multiple local minima may occur often
- ▶ No formal proof of capabilities
- ▶ No further constraints can be considered

Local Minima of PFM

Demand for an efficient (i.e. fast, robust, easy to implement) framework to plan robot motion supporting high DOF.

Ideas:

1. Random samples in the region of interest
2. Test the samples for collisions
3. Connect samples using simple trajectories
4. Search in the resulting graph

Motivation

Collision detection and distance estimation are faster than the generation of an explicit representation of free space.

⇒ Probabilistic Roadmaps

[14]

Milestones and Roadmaps

Milestones and Roadmaps

Milestones and Roadmaps

Milestones and Roadmaps

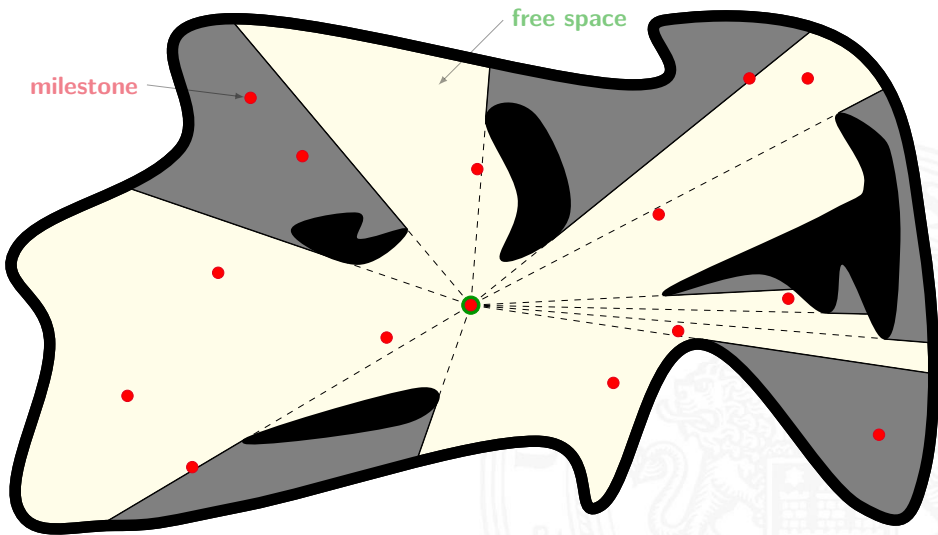

Milestones and Roadmaps

Milestones and Roadmaps

Parallels to the Art-Gallery-Problem

Problem 99% computation time of a probabilistic roadmap planner is used for collision checks.

Solution Intelligent strategy to reduce the size of the roadmap and thus the time for collision checks?

- ▶ Multi- vs single-exploration strategy
- ▶ Uniform
- ▶ Multi-level (coarse to fine)
- ▶ Obstacle-aware (shift colliding sample to free space)
- ▶ Lazy collision checks
- ▶ Probabilistic default values

[15]

Process of taking Samples

In an expansive free space: $P_{fail} \sim e^{-N}$
where N : the number of milestones

Successful 6D plan for narrow passages

(a)

(b)

(c)

(d)

(e)

(f)

Planning Results for a multi-joint artifact

Disadvantages

- ▶ No strict termination criteria, if no solution can be found
 - ▶ only probabilistic completeness (an existing solution will eventually be found...)
- ▶ Missing insight to planning process

Advantages

- ▶ Easy to implement
- ▶ Fast, scalable for problems with high DOF
- ▶ Rate of convergence increases with milestones

- ▶ Production: robot programming, assembly, layout planning
- ▶ Sequence generation for maintenance tasks
- ▶ Autonomous mobile robots
- ▶ Graphical animations
- ▶ Motion planning for medical appliances
- ▶ Simulation of realistic paths of cells and molecules
- ▶ ...

Using a path planner, the complexity of a product can be assessed.
The assembly-process can be planned.

Path planning combined with optimization methods generate optimal positioning of robots and other equipment in a work cell.

Humanoid (cont.)

Task-level Programming and Path Planning - Application fields

Introduction to Robotics

Humanoid (cont.)

[16]

High DOF path planning is required for humanoid motion

Path planner can be used to automatically check the disassembly methods of parts.

This way the products can be easier maintained and repaired.

Animation of Task Oriented Programming

Simulation and visualization gives insight to path planning resulting from task oriented programming.

Animation of Manipulation Scripts

Animation as Simulation

Task-level Programming and Path Planning - Application fields

Planning of Radiotherapy

Task-level Programming and Path Planning - Application fields

Introduction to Robotics

Generation of Docking Motion of Molecules

Task-level Programming and Path Planning - Extension of Basic Problem and Applications

Introduction to Robotics

Generation of Docking Motion of Molecules (cont.)

- ▶ moving obstacles
- ▶ multiple moving objects
- ▶ objects with deformable shape
- ▶ unspecified goals
- ▶ non holonomic constraints
- ▶ dynamic constraints
- ▶ planning for optimal time
- ▶ fuzzy sensing and plan execution
- ▶ highly complex artifacts

Handling of over 1000 degrees of freedom

Path planning for soft objects

Autonomous Virtual Actors

A Bug's Life (1998, Disney/Pixar)

Antz (1998, DreamWorks/PDI)

Toy Story 3 (2010, Disney/Pixar)

Final Fantasy VIII (1999, Square)

Tomb Raider 5 (2000, Eidos Interactive)

The Legend of Zelda: Skyward Swords (2011, Nintendo)

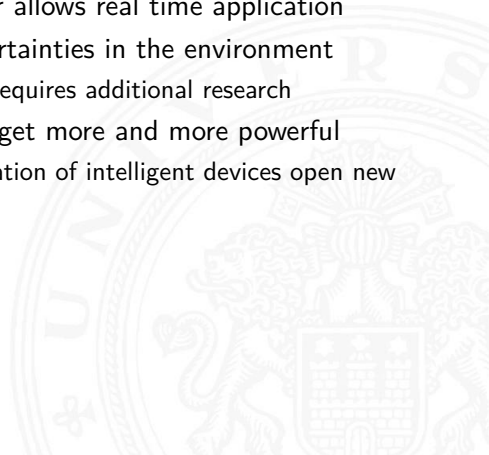

- ▶ Explicit representation of configuration space yields a complete solution
 - ▶ for sufficient resolution/precision
 - ▶ applicability is limited
- ▶ Distributed probabilistic approach for high DOF
- ▶ Path planning is native in the field of robotics
 - ▶ widely used in other fields
 - ▶ manufacturing, VR, animation, gaming, biology, chemistry, ...
- ▶ Simulated environments fulfill the requirements of geometrical path planning
 - ▶ known models of the environment
 - ▶ specified start and goal configurations
 - ▶ ideal execution

Summary (cont.)

- ▶ Increasing computation power allows real time application
- ▶ Real robots face various uncertainties in the environment
 - ▶ Extension of basic problem requires additional research
- ▶ Embedded (robotic) systems get more and more powerful
 - ▶ motion modeling and calculation of intelligent devices open new fields of research

- ▶ Library of sampling based motion planning algorithms
- ▶ Integrated in ROS arm navigation stack (used on the PR2)
- ▶ Integrated in MoveIt! project
- ▶ Includes state-of-the-art motion planning algorithms
- ▶ No collision checking
- ▶ Demo videos at
<http://ompl.kavrakilab.org/gallery.html>
- ▶ Tutorials on how to integrate OMPL at
http://wiki.ros.org/ompl_ros_interface/Tutorials

▶ Features

- ▶ kinematics
- ▶ dynamics
- ▶ collision
- ▶ checking
- ▶ constraint evaluation
- ▶ visualization
- ▶ ...

▶ Planning and executing motion plans for different robots

▶ Overview at <http://moveit.ros.org>

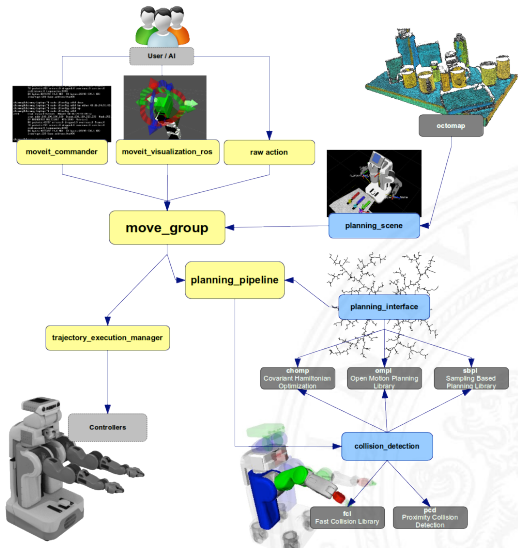

▶ Tools

- ▶ motion plan specification
- ▶ configuration
- ▶ debugging
- ▶ visualization
- ▶ benchmarking
- ▶ ...

Movelt! - A Planning Framework (cont.)

Task-level Programming and Path Planning - Practical Example: Path Planning with Movelt

Introduction to Robotics

Movelt! - A Planning Framework (cont.)

Task-level Programming and Path Planning - Practical Example: Path Planning with Movelt

Introduction to Robotics

The screenshot displays the Movelt! software interface, which is used for task-level programming and path planning. The interface is divided into several sections:

- Top Bar:** Contains various tool icons such as 'Interact', 'Move Camera', 'Select', 'Focus Camera', 'Measure', '2D Pose Estimate', '2D Nav Goal', and 'Publish Point'.
- Displays Panel:** Shows the 'Planned Path' configuration. The trajectory topic is set to `/move_group/display_planned_path`. Other settings include 'Show Robot Visual' (checked), 'Show Robot Collision' (checked), 'Robot Alpha' (0,5), 'State Display Time' (0,1 s), 'Loop Animation' (unchecked), and 'Show Trail' (unchecked). Below this panel are 'Add', 'Remove', and 'Rename' buttons.
- Motion Planning Panel:** Features tabs for 'Context', 'Planning', 'Scene Objects', 'Stored Scenes', and 'Stored States'. It is currently in the 'Planning' context.
 - Commands:** Includes 'Plan', 'Execute', and 'Terminal' buttons.
 - Query:** Allows selecting a start state (currently 'home_pose') and a goal state, with an 'Update' button.
 - Options:** Includes 'Planning Time (s)' set to 3,00, 'Allow Replanning' (unchecked), 'Allow Sensor Positioning' (unchecked), 'Path Constraints' set to 'None', and 'Goal Tolerance' set to 0,00.
 - Workspace:** Includes input fields for 'Center (XYZ)' (0,00, 0,00, 0,00) and 'Size (XYZ)' (2,00, 2,00, 2,00).
- 3D Viewport:** Shows a 3D simulation of a robot (a white and blue mobile base) in a dark environment. A green cube is positioned in front of the robot, and a blue path is visible on the floor. A red and green circular target is also visible in the scene.
- Time Panel:** Displays performance metrics: 'ROS Time: 1372422685.15', 'ROS Elapsed: 7586.12', 'Wall Time: 1372422685.20', and 'Wall Elapsed: 7586.08'. There is an 'Experimental' checkbox and a 'Reset' button.
