Value and Action Learned by Latent Imagination

Dreamer

## Agent Components

- ▶ Dynamics learning
- ▶ Behavior learning
- ▶ Environment interaction

## Latent Dynamics Model Components

- ▶ Representation model:  $p(s_t | s_{t-1}, a_{t-1}, o_t)$
- ▶ Transition model:  $q(s_t | s_{t-1}, a_{t-1})$
- ▶ Reward model:  $q(r_t | s_t)$

## Environment Interaction Model

- ▶ Actor critic
- ▶ Action model:  $a_\tau \sim q_\phi(a_\tau | s_\tau)$
- ▶ Value model:  $v_\psi(s_\tau) \approx \mathbb{E}_{q(\cdot|s_\tau)}(\sum_{T=\tau}^{t+H} \gamma^{T-t} r_T)$

# Dreamer

## Learning latent dynamics

Motivation

Dreamer

Dreaming

DreamerV2

DayDreamer

Conclusion

Appendix

Learning latent dynamics in Dreamer

1. Draw data sequences  $\{(a_t, o_t, r_t)\}_{t=k}^{k+L}$  from initial dataset
2. Compute model states  $s_t \sim p_\theta(s_t | s_{t-1}, a_{t-1}, o_t)$
3. Update neural network parameters  $\theta$  by representation learning

## Reward Prediction

## Reconstruction of Image

- ▶ Additional observation model:  $q(o_t | s_t)$  for learning signal

$$\mathcal{J}_{\text{REC}} = \mathbb{E}_p \left( \sum_t (\mathcal{J}_O^t + \mathcal{J}_R^t + \mathcal{J}_D^t) \right) + c$$

$$\mathcal{J}_O^t = \ln q(o_t | s_t) \quad \mathcal{J}_R^t = \ln q(r_t | s_t)$$

$$\mathcal{J}_D^t = -\beta \text{KL}(p(s_t | s_{t-1}, a_{t-1}, o_t) \parallel q(s_t | s_{t-1}, a_{t-1}))$$

### Contrastive Estimation

- ▶ Predict state from observation
- ▶ State model:  $q(s_t | o_t)$
- ▶ Noise contrastive estimation
  - ▶ Averaging over  $o' =$  observations of current sequence batch

$$\mathcal{J}_{\text{NCE}} = \mathbb{E}_p \left( \sum_t (\mathcal{J}_S^t + \mathcal{J}_R^t + \mathcal{J}_D^t) \right)$$
$$\mathcal{J}_S^t = \ln q(s_t | o_t) - \ln \left( \sum_{o'} q(s_t | o') \right)$$

# Dreamer

## Learning in Latent Space

Motivation

Dreamer

Dreaming

DreamerV2

DayDreamer

Conclusion

Appendix

Imagine future actions, values and rewards

1. Imagine trajectories  $\{(s_\tau, a_\tau)\}_{\tau=t}$  from each  $s_t$
2. Predict rewards  $\mathbb{E}(q_\theta(r_\tau | s_\tau))$  and values  $v_\psi(s_\tau)$
3. Compute value estimation  $V_\lambda(s_\tau)$
4. Update action model -  $\phi$  and value model parameters  $\psi$

## Value Estimation

- ▶ Exponentially-weighted average of estimates

$$V_\lambda(s_\tau) = (1 - \lambda) \sum_{n=1}^{H-1} \lambda^{n-1} V_N^n(s_\tau) + \lambda^{H-1} V_N^H(s_\tau)$$

$$V_N^k(s_\tau) = E_{q_\theta, q_\phi} \left( \sum_{n=\tau}^{h-1} \gamma^{n-\tau} r_n + \gamma^{h-\tau} v_\psi(s_h) \right)$$

with  $h = \min(\tau + k, t + H)$

## Independent linear Dynamics

- ▶ Multi-step prediction model:

$$\tilde{p}(z_t \mid z_{t-k}, a_{<t}) := \mathbb{E}_{\tilde{p}(z_{t-1} \mid z_{t-k}, a_{<t-1})} [\tilde{p}(z_t \mid z_{t-1}, a_{t-1})]$$

- ▶ Hyperparameter  $k$ : latent overshooting
- ▶ New objective:

$$\mathcal{J} := \sum_{k=0}^K (\mathcal{J}_k^{\text{NCE}} + \mathcal{J}_k^{\text{KL}})$$

$$\mathcal{J}_k^{\text{NCE}} := \mathbb{E}_{\tilde{p}(z_t \mid z_{t-k}, a_{<t}) q(z_{t-k} \mid \cdot)} \left[ \ln p(z_t \mid x_t) - \ln \sum_{x' \in D} p(z_t \mid x') \right]$$

$$\mathcal{J}_k^{\text{KL}} := \mathbb{E}_{p(z_t \mid z_{t-k}, a_{<t}) q(z_{t-k} \mid x_{\leq t-k}, a_{<t-k})} \left[ \text{KL}(q(z_{t+1} \mid x_{\leq t+1}, a_{<t+1}) \parallel p(z_{t+1} \mid z_t, a_t)) \right]$$
